

BART'S LINEAS

...on the left, the right side of the
 LOOINER. BLOOMING WIND
 BLOOMING FLOWERS AND THE BLOOMING
 LATE IN THE DAY BLOOMING
 FIRST BLOOMING BLOOMING.

Chlorophyll is the green pigment in plants that captures light energy and converts it into chemical energy through the process of photosynthesis. The chloroplasts in plant cells contain chlorophyll and are the site of photosynthesis. The chloroplasts are surrounded by a double membrane and contain a fluid called stroma. The chloroplasts are the powerhouses of the plant, converting light energy into chemical energy that can be used by the plant for growth and development.
