Chlorzelenolone is a non-steroidal anti-inflammatory drug (NSAID) used to relieve pain and reduce inflammation. It is commonly used to treat conditions such as osteoarthritis, rheumatoid arthritis, and menstrual pain. The drug works by inhibiting the production of prostaglandins, which are chemicals that cause pain and swelling. Chlorzelenolone is available in tablet form and is typically taken orally. It is important to use this medication as directed by a healthcare professional, as overuse can lead to serious side effects such as stomach ulcers and kidney damage. Common side effects include dizziness, headache, and indigestion. Chlorzelenolone should be avoided in people with certain medical conditions, such as peptic ulcers and kidney disease, and it should be used with caution in pregnant and breastfeeding women.
